

The Isolation Approach™ - helping you trade

At **MTPredictor™** there is none of the confusion for traders caused by other software using Elliott wave (EW)...

1. The software isolates 3 variants of one specific Elliott wave pattern to find low risk/high return trade set-ups - the simple ABC correction-to-trend. This avoids the confusion of:

- *complex* EW patterns eg. ABCDE corrections, ascending/descending diagonal 5ths etc., which complicate trading
- *alternate* EW counts, which lead to differing trade scenarios - a common problem with standard Elliott wave analysis
- *wave re-labelling* mid-trade - another problem in many other Elliott wave programs

2. The software isolates the ABC trade set-up pattern from all other interference - it searches for the three key Trade Set-ups only on the most recent chart history and without reference to any other influence. So any set-up found is both current and isolated. This avoids the confusion of:

- trying to decide *where* you are right now in any EW pattern, which can change if you follow traditional EW techniques
- trying to *link* a current EW pattern with previous patterns - again a unique approach compared with standard EW analysis
- trying to *fit* a current EW pattern into either longer-term or shorter-term timeframes eg. A Daily chart pattern up into a Weekly pattern or down into a 60min. pattern

>> **An isolated trade set-up is treated in isolation from all interference**

This enables you to 1).**evaluate the Risk/Reward** on each set-up before deciding whether to take the trade and 2).**monitor the Risk/Reward** during a trade because:

- the initial stop loss is always just beyond the extreme bar of the ABC correction;
- the entry level is always just beyond the extreme of the price reversal bar;
- the profit zones are calculated & displayed on-screen based on the price targets of the trade set-up in isolation - so these Reward levels are known and unmovable.

Now it is possible to trade Elliott wave
